POWER BI PITCH

Vitalis Healthcare

Two in three booked visits never happen. Here is what to do about it.

Bih Brandy Sango. Based on a synthetic dataset.

Two in three visits do not happen

33.7%

Attended

6,739 visits

33.2%

Cancelled

6,636 visits

33.1%

No-show

6,625 visits

20,000 appointments, 5 clinics, 120 doctors, December 2024 to December 2025

Only a third of billing is on completed visits

Completed visits

Cancelled visits

No-shows

$6.31M billed
Across 18,000 bills. I call this “billed”, not “revenue”.

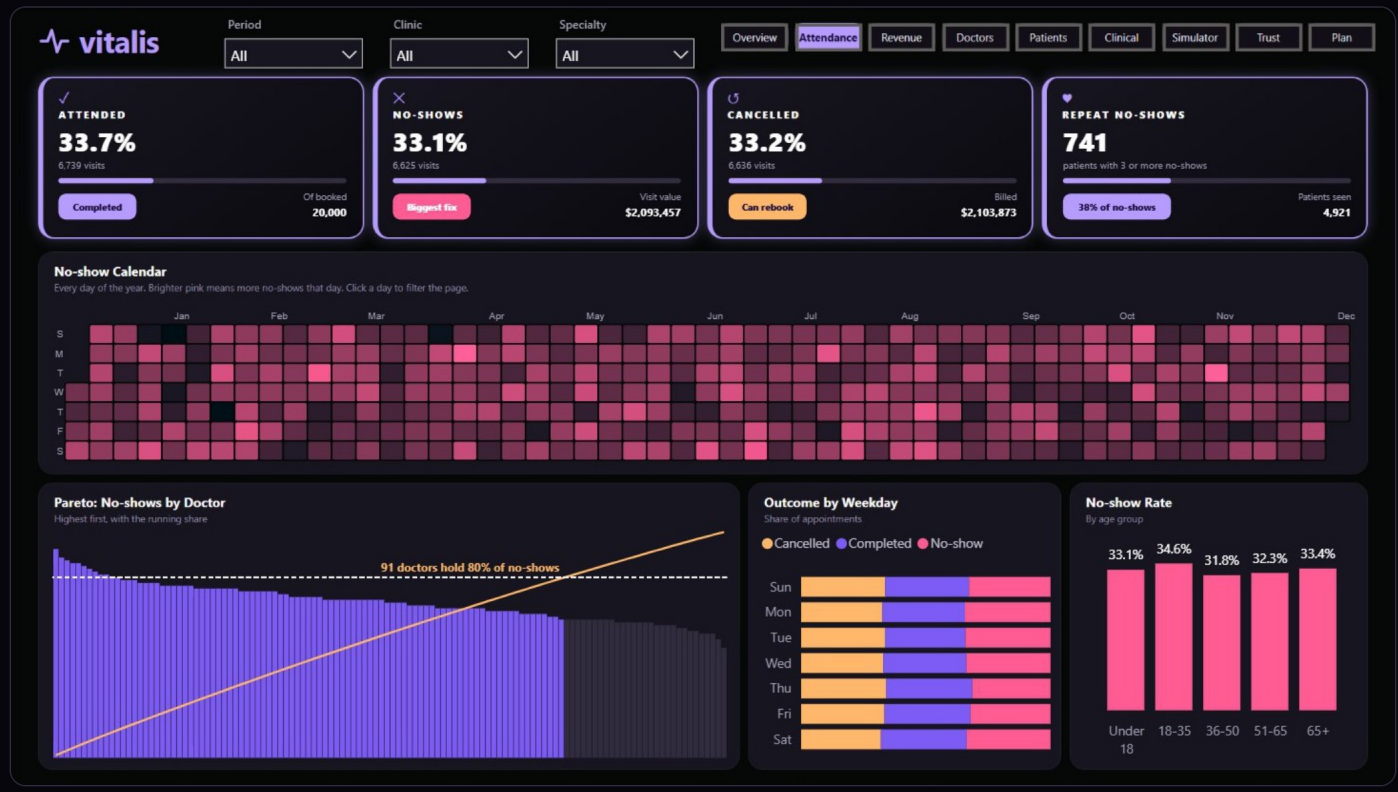

$4.18M to audit
Sits on visits that were cancelled or missed.

Insurers cover 57.2% of what is billed and patients 42.8%

Repeat no-shows are a clear target

741

patients with three or more no-shows account for **38% of all no-shows**.

It takes 91 of 120 doctors to reach 80% of no-shows, so targeting patients beats targeting doctors

Clinic size follows headcount

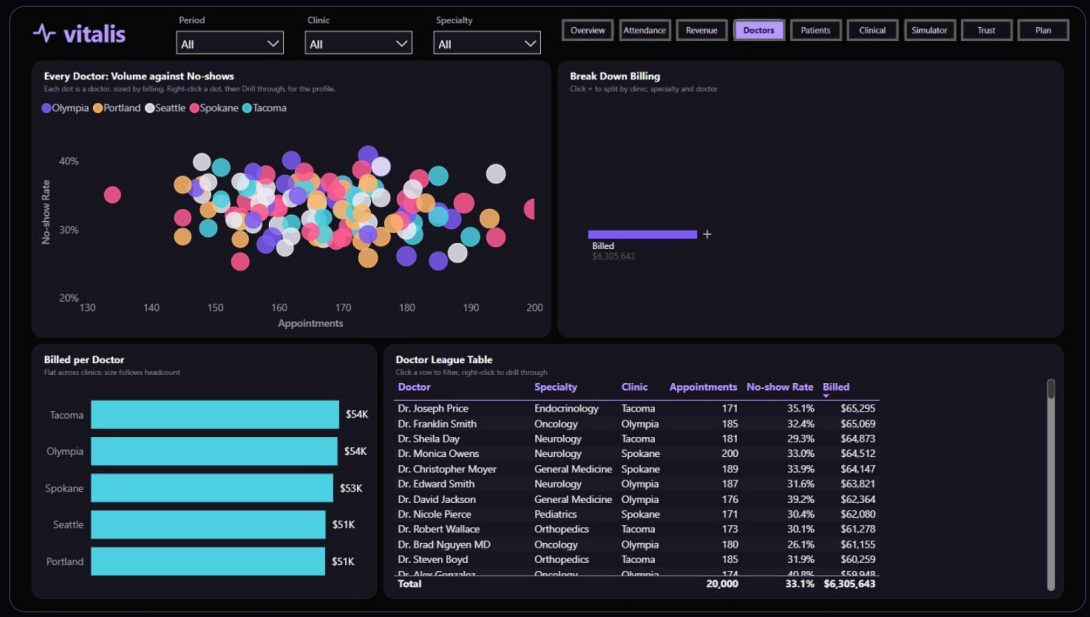

Clinic	Doctors	Billed	Per doctor
Seattle	28	$1.43M	$51K
Spokane	26	$1.37M	$53K
Tacoma	23	$1.25M	$54K
Portland	23	$1.18M	$51K
Olympia	20	$1.08M	$54K

Seattle bills the most because it has the most doctors. **Each doctor bills about the same everywhere.**

No-show rates across clinics sit between 32.2% and 33.6%

One report answers each question

Page	It answers
Overview	How is the practice doing?
Attendance	Who misses visits, and when?
Revenue	Where does billing sit?
Doctors	How does each doctor compare?
Patients	Who are the patients?
Clinical	What conditions are treated?
Simulator	What is a fix worth?
Data Trust	What should be checked?
Plan	What should happen next?

Every chart filters the page when clicked, so a manager can follow a question down to one doctor.

Cutting no-shows has a clear value

Cut 10%

+$209K

663 more visits

37.0% attendance

Cut 20%

+$419K

1,325 more visits

40.3% attendance

Cut 30%

+$628K

1,988 more visits

43.6% attendance

Today’s attendance is 33.7%. Managers can change the cut and add rebooked cancellations in the report.

Assumes $316 per recovered visit, the billing per completed visit. This sizes the opportunity and is not a forecast.

Three actions to start with

1

Audit billing on missed visits

Find out why $4.18M is billed on cancelled visits and no-shows.

2

Target repeat no-show patients

Start reminders and a confirm-or-release rule with the 741.

3

Rebook cancellations at once

Offer the next open slot when someone cancels.

Next: one bill per visit, cleaner specialty routing, and cost data so the report can show profit

What to check before trusting the data

66.0%
of bills are on cancelled visits or no-shows

40.2%
of completed visits have no bill

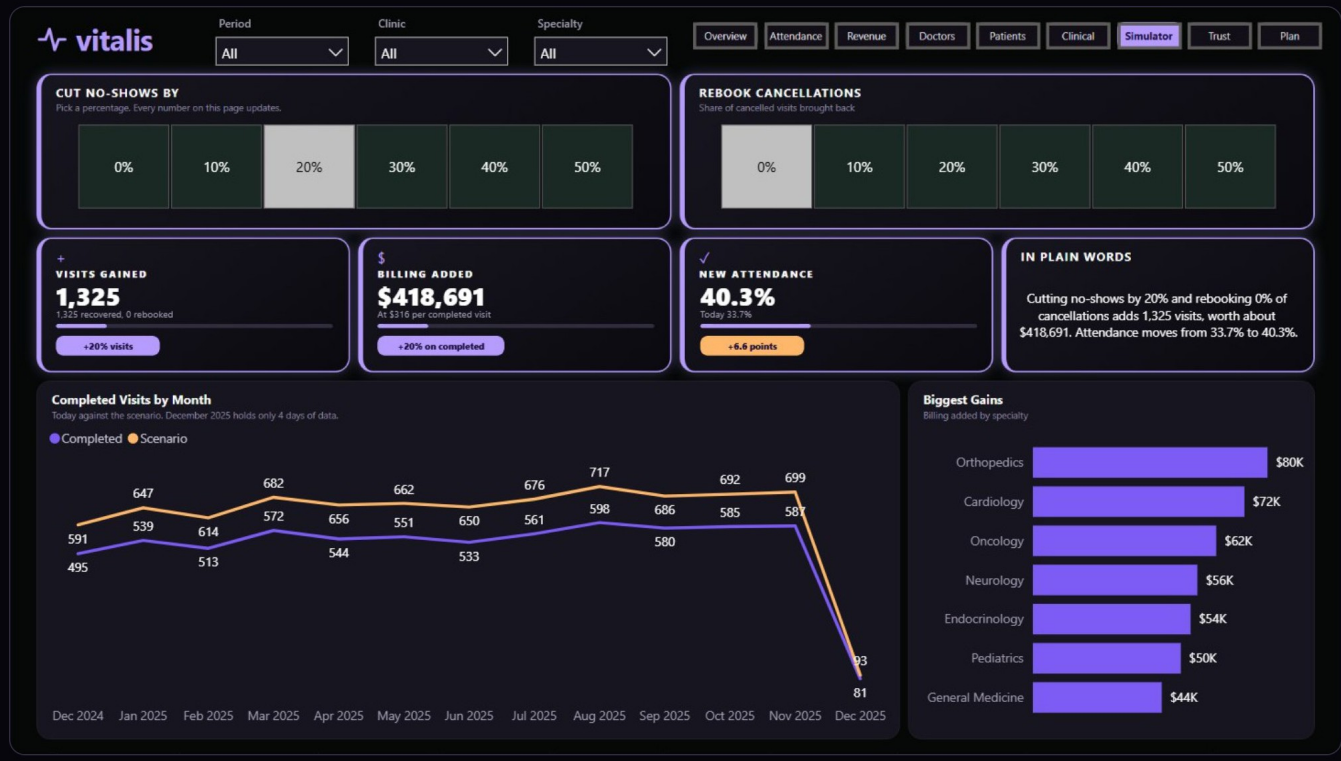

34.0%
of bills are extras on an already billed visit

79.7%
of pediatric visits are by adults

The dataset is synthetic, so these are signs of how it was generated. In a real clinic each would need an answer.

Built in Power BI from raw tables

- 6 source tables joined in a star-style model
- 61 DAX measures
- Deneb for the calendar, Pareto chart and heatmap
- Filters, a Play button and simulator tiles

Tools: Power BI Desktop, DAX, Power Query, Deneb

Start with the billing audit and the 741 patients.

A 20% cut in no-shows would bring back 1,325 visits, worth about $419K.
